

Big Data Hadoop—Real Time Project— Insurance

Jayateertha M Tatti

joy.tat@gmail.com

26-Oct-2016

Analyze health reports across years for the US market

A US-based insurance provider has decided to launch a new medical insurance program targeting various customers. To help this customer understand the current realities and the market better. We have to perform a series of data analytics tasks using Hadoop. The customer has provided the data set.

Project goals:

- 1) Calculate the average % of people, aged between 18 and 64, who have obtained insurance from private players from 2001 to 2011
- 2) Calculate the average percentage of people, aged 65 years or more, who are solely covered by public insurance from the year 2001 to 2011

Data set in xls format from the URL :

<http://www.census.gov/hhes/www/hlthins/data/utilization/tables.html>

Note: I have downloaded from SimpliLearn download section.

Hadoop Architecture

- Vmware
- Linux Ubuntu 16.04 Lts
- Hadoop 2.7.2

```
admin@poorvi-HP-Pavilion-dv4-Notebook-PC:~$ hadoop version
Hadoop 2.7.2
Subversion https://git-wip-us.apache.org/repos/asf/hadoop.git -r b165c4fe8a74265c792ce23f546c64604acf0e41
Compiled by jenkins on 2016-01-26T00:08Z
Compiled with protoc 2.5.0

```

Approach

- Referred lesson 3 to load the dataset in HDFS

- Referred lesson 6 Pig to arrive at the below results detailed in following pages

Conversion xls to csv files

For conversion linux gnumeric was used

Input files are listed below

```
admin@poorvi-HP-Pavilion-dv4-Notebook-PC:~/Documents/SimpliLearn/Hadoop/Downlaod/projects/Insurance_Data_Set/data/back/excel$ ls
2001.xls 2002.xls 2003.xls 2004.xls 2005.xls 2009.xls 2010.xls 2011.xls
```

ssconvert -S 2001.xls 2001.csv

ssconvert created one csv per sheet. Hence 0 to 5 csv files for each xls files.

Refer the image below

```
admin@poorvi-HP-Pavilion-dv4-Notebook-PC:~/Documents/SimpliLearn/Hadoop/Downlaod/projects/Insurance_Data_Set/data$ ls
2001.csv.0 2001.csv.5 2002.csv.4 2003.csv.3 2004.csv.2 2005.csv.1 2009.csv.0 2009.csv.5 2010.csv.4 2011.csv.3
2001.csv.1 2002.csv.0 2002.csv.5 2003.csv.4 2004.csv.3 2005.csv.2 2009.csv.1 2010.csv.0 2010.csv.5 2011.csv.4
2001.csv.2 2002.csv.1 2003.csv.0 2003.csv.5 2004.csv.4 2005.csv.3 2009.csv.2 2010.csv.1 2011.csv.0 2011.csv.5
2001.csv.3 2002.csv.2 2003.csv.1 2004.csv.0 2004.csv.5 2005.csv.4 2009.csv.3 2010.csv.2 2011.csv.1 back
2001.csv.4 2002.csv.3 2003.csv.2 2004.csv.1 2005.csv.0 2005.csv.5 2009.csv.4 2010.csv.3 2011.csv.2
```

Data cleaning performed:

The original file has hierarchical data stored in csv format. The Tab4 (after split <year>.csv.3) contains the data to be processed. For a given requirement there multiple records are present. We need to fetch the specific parent child relation records. Hence I took data cleaning approach to analyze the data set. Read the parent value append it to child value (*logic listed in python code*). So that data becomes normalized. On this data set DML operations can be performed. Refer the image of insurance_clean_data.py to clean data. Once the data is cleaned upload to CloudLab for further processing using Pig.

```

import xlrd
import csv
import glob
import pandas as pd

def List_All_CSV_Files_From_Folder(filePath, fileType):
    allFiles = glob.glob(filePath + fileType)
    list_ = []
    for file_ in allFiles:
        #Call Append_Year_To_CSV method
        #Append_Year_To_CSV(file_, file_)
        clean_data(file_)
    #Add the root data to all child data for processing
def clean_data(inputFileName):
    content = []
    total_per = []
    dataframe = pd.read_csv(inputFileName, usecols=[0,1], header=None)
    previous_data=''
    for index, row in dataframe.iterrows():
        data, per, i = row[0], row[1], index
        if data[0] == ' ':
            data = previous_data + data.strip()
        else :
            previous_data = data
    content.append(data)
    total_per.append(per)
    #Create DataFrame with required columns only
    CleanedDataFrame = pd.DataFrame({'Insurance_Description':content, 'Total_Per': total_per})
    #Create the csv file using required columns
    #print 'outputFileName : ' + outputFileName
    CleanedDataFrame.to_csv(inputFileName+'.csv', index=None)

def Process_File():
    #print 'Started Processing files..'
    filePath = r'/home/admin/Documents/SimpliLearn/Hadoop/Downlaod/projects/Insurance_Data_Set/data' # use your path
    fileType = '/*.csv.3'
    List_All_CSV_Files_From_Folder(filePath, fileType)

Process_File()

```

- Above python code converts *.3 files *.3.csv files
- Upload the *.csv.3.csv files to cloudlab in insurance folder
- Execute pig scripts on these files

Refer Uploaded CloudLab file image
